## Vickers Hardness Test - Test Method

### Introduction

This Standard has been prepared based on the third edition of **ISO 6507-1** and the first edition of **ISO 6507-4** published in 2005 with some modifications of the technical contents. The portions given dotted underlines are the matters in which the contents of the corresponding International Standards have been modified.

### 1 Scope

This Standard specifies the Vickers hardness test method, for the three different ranges of test force for metallic materials (see table 1).

**Table 1 Ranges of test force**

Ranges of test force, $F$ N	Hardness symbol	Designation
$F \geq 49.03$	$\geq HV\ 5$	Vickers hardness test
$1.961 \leq F < 49.03$	$HV\ 0.2$ to $< HV\ 5$	Low force Vickers hardness test
$0.098\ 07 \leq F < 1.961$	$HV\ 0.01$ to $< HV\ 0.2$	Vickers microhardness test

The Vickers hardness test is specified in this Standard for lengths of indentation diagonals between 0.020 mm and 1.400 mm. The Vickers hardness test for lengths of indentation diagonals less than 0.020 mm and the test force of less than 98.07 mN however, may be in accordance with this Standard upon the agreement between the purchaser and the supplier.

For specific materials and/or products, particular Japanese Industrial Standards exist.

**NOTE** 1: For indentation diagonals less than 0.020 mm, the increase of the uncertainty has to be considered.

2: In general, decreasing the test force increases the scatter of results of the measurements.

This is particularly true for low-force Vickers hardness tests and Vickers microhardness tests, where the principal limitation will arise in the measurement of the diagonals of the indentation. For Vickers microhardness, the accuracy of determination of the mean diagonal length is unlikely to be better than  $\pm 0.001$  mm.

3: The International Standards corresponding to this Standard is as follows.

ISO 6507-1: 2005 Metallic materials - Vickers hardness test

Part 1: Test Method

ISO 6507-4: 2005 Metallic materials-Vickers hardness test

Part 4: Tables of hardness values

(Overall evaluation: MOD)

In addition, symbols which denote the degree of correspondence in the contents between the relevant International Standards and JIS are IDT (identical), MOD (modified), and NEQ (not equivalent) according to ISO/IEC Guide 21

## 2 Normative references

The following standard contains provisions which, through reference in this text, constitute provisions of this Standard. The most recent edition of the standard (including amendments) indicated below shall be applied.

**JIS B7725** Vickers hardness test- Verification of testing machines. NOTE: At the time of revision of this Standard, JIS B 7725 corresponded to ISO. 6507-2:1997, however, ISO 6507-2 has already been revised and published as 2005 version.

## 3 Principle

A diamond indenter, in the form of a right pyramid with a square base and with a specified angle between opposite faces at the vertex, is forced into the surface of a test piece followed by measurement of the diagonal length of the indentation left in the surface after removal of the test force,  $F$  (see figure 1).

The Vickers hardness is proportional to the quotient obtained by dividing the test force by the sloping area of the indentation, which is assumed to be a right pyramid with a square base, and having at the vertex the same angle as the indenter.

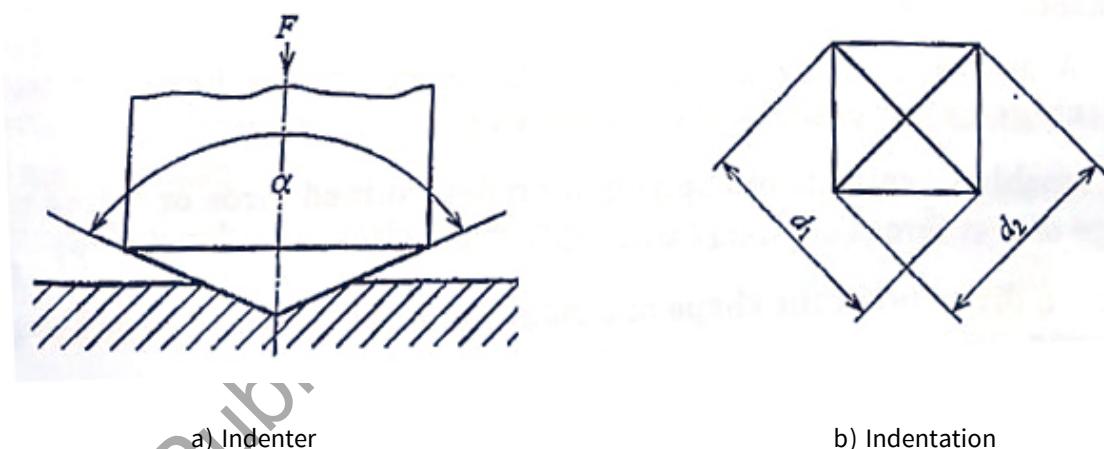

Figure 1 Principle of the test

## 4 Symbols and designation of hardness

### 4.1 Symbols and designation thereof

See table 2 and figure 1.

**Table 2 Symbols and designations thereof**

Symbol	Designation
$\alpha$	Angle between the opposite faces at the vertex of the pyramidal indenter ( $136^\circ$ )
$F$	Test force, in newtons (N)
d	Arithmetic mean, in millimetres, of the two-diagonal length $d_1$ and $d_2$ of the indentation (see figure 1)
HV	Vickers hardness = Constant $\times \frac{\text{Test force}}{\text{Surface area of indentation}}$ $= 0.102 \frac{2F \sin 136^\circ}{d^2} = 0.189 \frac{F}{d^2}$

NOTE: Constant =  $0.102 \approx 1/9.806\ 65$ , where 9.806 65 is the conversion factor from kgf to N.

#### 4.2 Designation of Vickers hardness

The following is an example of the designation of Vickers hardness HV.

##### Example

640    HV    30    /20

Duration time of test force (20 s)

if not within the specified range (10 s to 15 s)

Approximate kgf equivalent value of applied  
test force where (30 kgf = 294.2 N)

Hardness symbol

Vickers hardness value

#### 5 Testing machine

NOTE: A suggested procedure for periodic checks of the hardness testing machine by the users is given in Annex C.

**5.1** Testing machine capable of applying a predetermined force or forces within the required range of test forces, in accordance with **JIS B 7725**.

**5.2** Indenter a diamond in the shape of a right pyramid with a square base, as specified in **JIS B 77285**.

**5.3 Measuring system as specified in JIS B 7725.**

## **6 Test piece**

The test piece shall be as follows.

a) The test shall be carried out on a surface which is smooth and event, free from oxide scale, foreign matter and, in particular, completely free from lubricants, unless otherwise specified in product standards. The finish of the surface shall permit accurate determination of the diagonal length of the indentation.

b) Preparation shall be carried out in such a way that any alteration of the surface hardness, due to excessive heating or cold-working, for example, is minimized.

Due to the small depth of Vickers microhardness indentations, it is essential that special precautions are taken during preparation. It is recommended to use a polishing/ electropolishing process which is suitable for the material parameters.

c) The thickness of the test piece, or of the layer under test, shall be at least 1.5 times the diagonal length of the indentation (see Annex A).

No deformation shall be visible at the back of the test piece after the test.

d) For tests on curved surfaces, the corrections given in Annex B, tables B.1 to B.6 shall be applied.

e) For test pieces of small cross-section or of irregular shape, it may be necessary to provide some form of additional support.

NOTE: In the preparation and testing of the test piece of small dimension or of complicated shape, it is recommended to hold it by using particular holders or by embedding it in resin. However, the method employed shall not affect the hardness of the test piece. When embedding the test piece in resin, care shall be taken because the heat generation along with hardening of resin, and pressure and temperature during press forming may affect the hardness of the test piece.

## **7 Procedure**

The procedure shall be as follows.

a) In general, the test is carried out at ambient temperature within the limits of 10 °C to 35 °C. Tests carried out under controlled conditions shall be made at a temperature of (23 ± 5) °C.

b) The test forces given in table 3 shall be used. Other test forces than that given in table 3 may be used.

NOTE: Other values., HV 2.5 (24.52 N) may be used.

**Table 3 Test forces**

Hardness test <sup>a)</sup>		Low-force hardness test		Microhardness test	
Hardness symbol	Nominal value of the test force F N	Hardness symbol	Nominal value of the test force F N	Hardness symbol	Nominal value of the test force F
HV5	49.03	HV0.2	1.961	HV0.01	0.098 07
HV10	98.07	HV0.3	2.942	<b>HV0.015</b>	0.147 1
HV20	196.1	HV0.5	4.903	<b>HV0.02</b>	0.196 1
HV30	294.2	HV1	9.807	HV0.025	0.245 2
HV50	490.3	HV2	19.61	HV0.03	0.294 2
HV100	980.7	HV3	29.42	HV0.05	0.490 3
				HV0.1	0.980 7

Note <sup>a)</sup> Nominal test forces greater than 980.7 N may be applied.

- c) The test piece shall be placed on a rigid support. The support surfaces shall be clean and free from foreign matter (scale, oil, dirt, etc.). It is important that the test piece lies firmly on the support so that displacement cannot occur during the test.
- d) Bring the indenter into contact with the test surface and apply the test force in a direction perpendicular to the surface, without shock or vibration, until the applied force attains the specified value. The time from the initial application of the force until the full test force is reached shall not be less than 2 s nor greater than 8 s. For low-force hardness and microhardness tests, the maximum time shall not exceed 10 s. For low-force hardness and microhardness tests, the approach speed of the indenter shall not exceed 0.2 mm/s.

For micro-hardness tests, the indenter should contact the test piece at a velocity between 15  $\mu\text{m/s}$  and 70  $\mu\text{m/s}$ .

In the case where appropriate condition is recommended to the testing machine, that condition may be subjected.

The duration of the test force shall be 10 s to 15 s, except for tests on materials whose time-dependent properties would make this an unsuitable range. For these tests, a longer duration is permitted and this duration shall be specified as part of the hardness designation (see Example in 4.2).

- e) Throughout the test, the testing machine shall be protected from shock or vibration.
- f) The distance between the centres of two adjacent indications and between any indentation and the edge of the test piece shall be the ratio to the mean diagonal length of the indication  $d$  specified in table 4.

**Table 4 Position of indentation**

Material of test piece	Steel, nickel alloy, titanium alloy, copper and copper alloy	Light metal (except for titanium alloy), lead, tin and their alloys
The distance between the centres of two adjacent indications <sup>a)</sup>	At least 3 $d$	At least 6 $d$
The distance between the centre of any indentation and the edge of test piece	At least 2.5 $d$	At least 3 $d$
Note <sup>a)</sup> If two adjacent indentations differ in size, the spacing $d$ shall be based on the mean diagonal length of the larger indentation.		

- g) Measure the lengths of the two diagonals. The arithmetical mean of the two readings shall be taken for the calculation of the Vickers hardness.  
For flat surfaces, the difference between the lengths of two indentation diagonals should not be greater than 5 %. If the difference is greater, this shall be stated in the test report.  
Magnifications should be provided so that the diagonal can be enlarged to greater than 25 %, but less than 75 % of the field of view.
- h) Annex D contains calculation tables which shall be used to determine the Vickers hardness for tests on flat surfaces.

## 8 Uncertainty of the results

A complete evaluation of the uncertainty should be done according to the ISO Guide to the expression of uncertainty in measurement (GUM) [1].

Independent of the type of sources, for hardness there are two possibilities for the determination of the uncertainty.

- a) One possibility is based on the evaluation of all relevant sources appearing during a direct calibration. As a reference, an EA guideline [2] is available.
- b) The other possibility is based on indirect calibration using a hardness reference block [below abbreviated as CRM (certified reference material)] (see [2-5] in the Bibliography).

NOTE: A guideline for the determination of uncertainty is given in Annex D to ISO 6507-1.

## 9 Test report

The test report, if necessary, shall include the information selected from the following upon the agreement between the purchaser and the supplier:

- a) a reference to this Standard;
- b) all details necessary for identification of the test piece;
- c) the result obtained;

- d) all operations not specified in this Standard, or regarded as optional;
- e) details of any occurrence which may have affected the results;
- f) the temperature of the test, if it is outside the range specified in 7 a).

- NOTE 1** A strict comparison of hardness values is only possible at identical test forces
- 2 There is no general process of accurately converting Vickers hardness into other scales of hardness or into tensile strength. Such conversions, therefore, should be avoided, unless a reliable basis for conversion can be obtained by comparison tests.
  - 3 It should be noted that for anisotropic materials, for example those which have been heavily cold-worked, there will be a difference the lengths of the two diagonals of the indentation. Where possible, the indentation should be made so that the diagonals are inclined at approximately 45° to the direction of cold-working. The specification for the product may indicate limits for the differences between the lengths of the two diagonals.
  - 4 There is evidence that some materials may be sensitive to the rate of straining which causes small changes in the value of the yield strength. The corresponding effect on the termination of the formation of an indentation can make alterations in the hardness value.

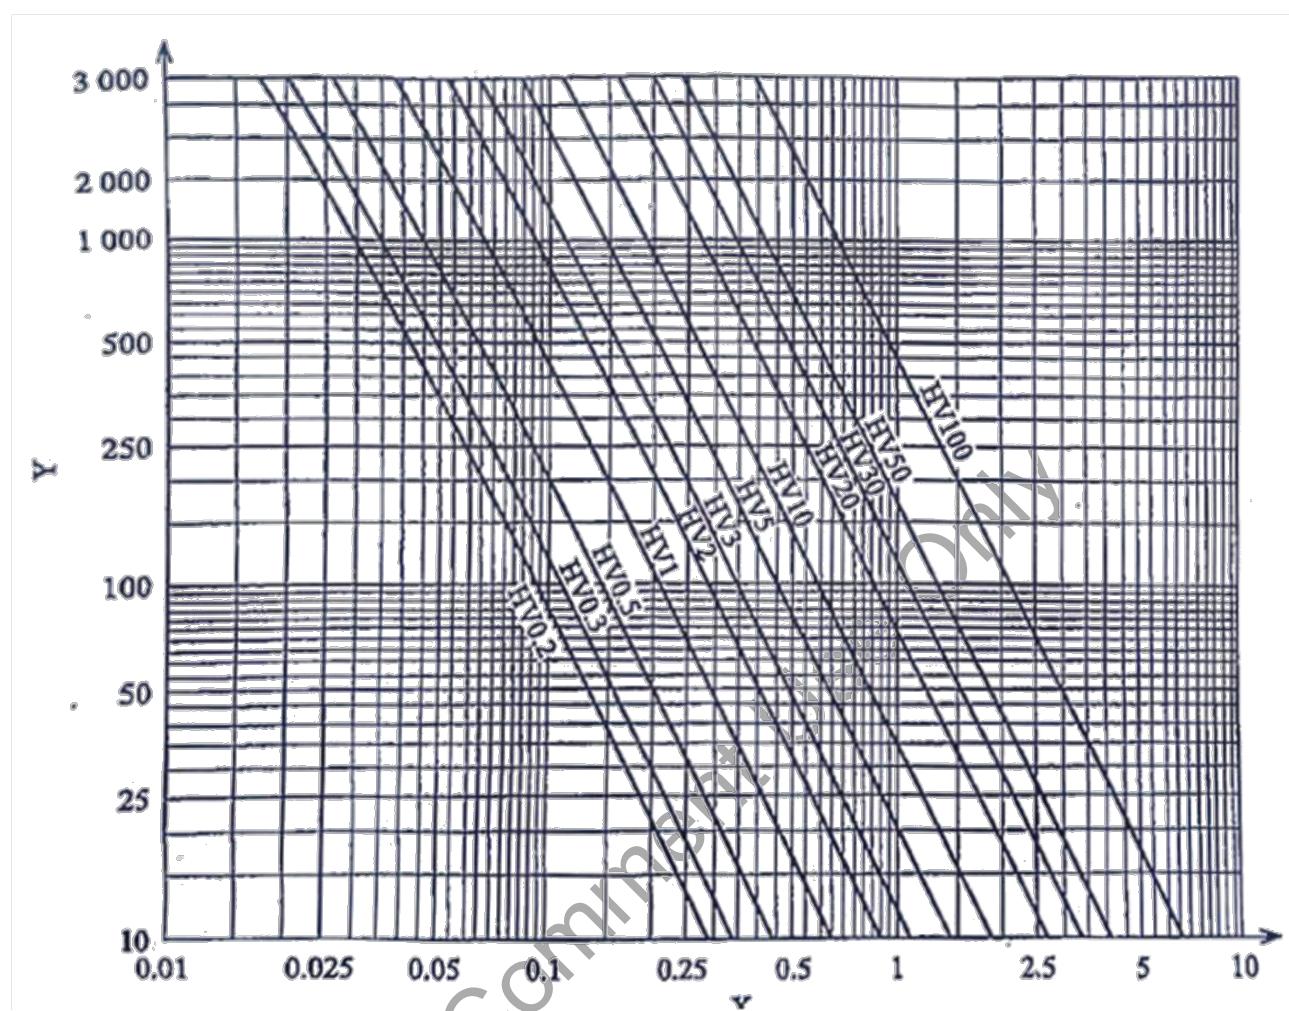

**Annex A (normative)****Minimum thickness of the test piece in relation  
to the force and to the hardness****Introduction**

This Annex specifies the minimum thickness of the test piece required in relation to the test force and to the hardness.

**A.1 Obtaining method for the minimum thickness**

Figure A.1 has been designed for obtaining the thickness which becomes 1.5 times the diagonal length of the indentation based on the hardness symbol and the hardness value. The minimum thickness of a test piece is given by the X-axis value of the point of intersection of the hardness symbol line used and the Y-axis hardness value.

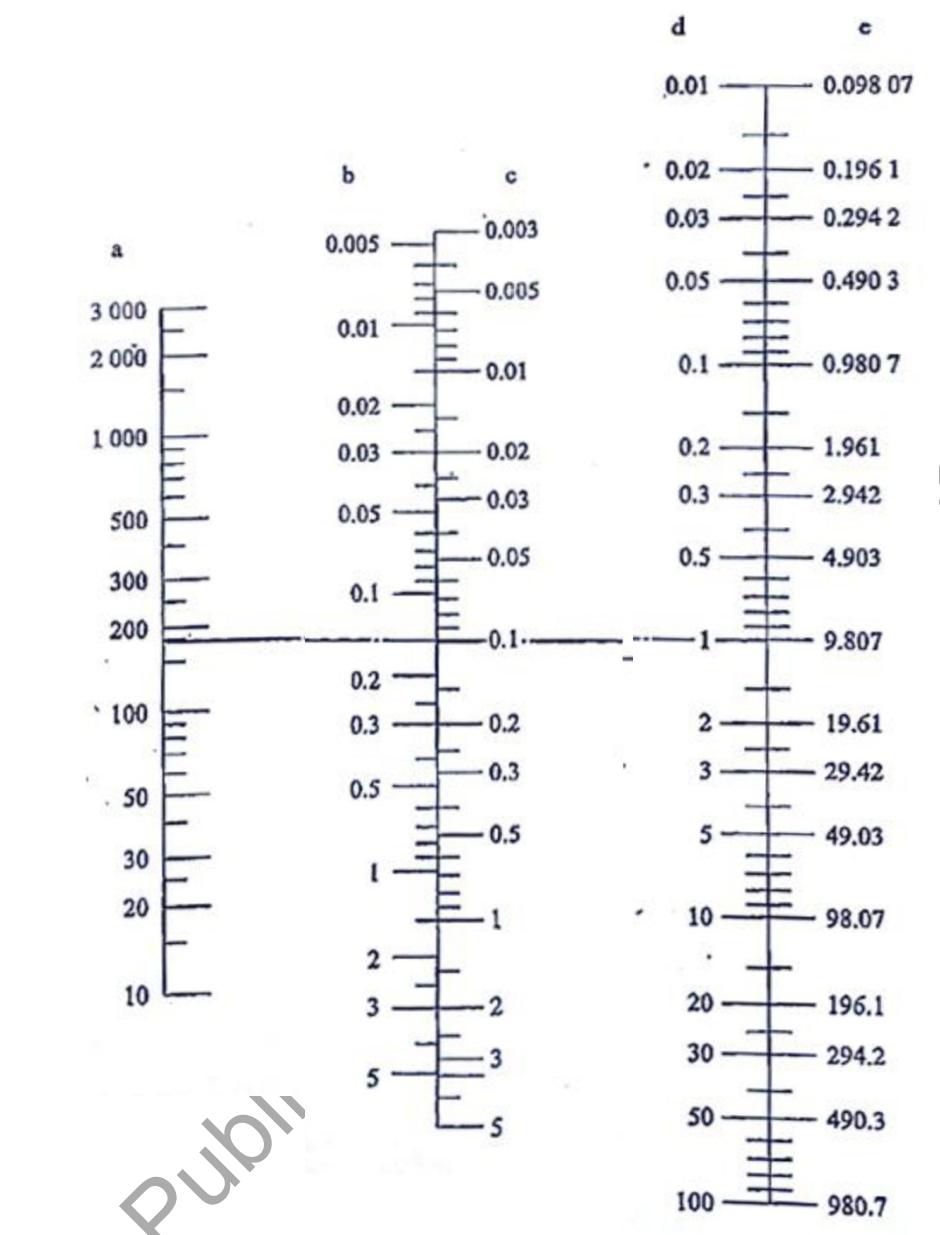

The nomogram shown in figure A.2 has been designed for minimum thickness of a test piece, assuming that the minimum thickness has to be 1.5 times the diagonal length of the indentation. The required thickness is given by the point of intersection of the minimum thickness scale and a line (shown long dashed dotted in the example in figure A.2) joining the test force (right-hand scale) with the hardness (left-hand scale).

X Thickness of the test piece (nm)

Y Hardness (Hv)

**Figure A.1** Minimum thickness of the test piece in relation to the test force and to the hardness (HV 0.2 to HV 100)

- a Hardness value, HV
- b Minimum thickness,  $t$  (mm)
- c Diagonal length,  $d$  (mm)
- d Hardness symbol, HV
- e Test force  $F$  (N)

**Figure A.2 Nomogram designed for the minimum thickness of the test piece (HV 0.01 to HV 100)**

**Annex B (normative)****Tables of correction factors for use in tests made on curved surfaces****Introduction**

This Annex specifies the correction factors when tests are made on curved surfaces.

**B.1 Spherical surfaces**

Tables B.1 and B.2 give the correction factors when tests are made on spherical surfaces.

The correction factors are tabulated in terms of the ratio of the mean diagonal  $d$  of the indentation to the diameter  $D$  of the sphere.

**Example**

Convex sphere,  $D = 10$  mm

Test force,  $F = 98.07$  N

Mean diagonal of indentation,  $d = 0.150$  mm

$$\underline{d} = \underline{0.15} = 0.015$$

$$\underline{D} = 10$$

$$\text{Vickers hardness } \frac{0.189 \times 98.07}{0.15^2} = 824 \text{ HV10}$$

Correction factor from table B.1, by interpolation = 0.983

Hardness of sphere =  $824 \times 0.983 = 810$  HV 10

**Table B.1 Convex spherical surfaces**

d/D	Correction factor	d/D	Correction factor
0.004	0.995	0.086	0.920
0.009	0.990	0.093	0.915
0.013	0.985	0.100	0.910

0.043	0.955	0.147	0.880
0.049	0.950	0.156	0.875
0.055	0.945	0.165	0.870
0.061	0.940	0.175	0.865
0.067	0.935	0.185	0.860
0.073	0.930	0.195	0.855
0.079	0.925	0.206	0.850

### B.2 Cylindrical surfaces

$d/D$	Correction factor	$d/D$	Correction factor
0.004	1.005	0.057	1.080
0.008	1.010	0.060	1.085
0.012	1.015	0.063	1.090
0.016	1.020	0.066	1.095
0.020	1.025	0.069	1.100
0.024	1.030	0.071	1.105
0.028	1.035	0.074	1.110
0.031	1.040	0.077	1.115
0.035	1.045	0.079	1.120
0.038	1.050	0.082	1.125
0.041	1.055	0.084	1.130
0.045	1.060	0.087	1.135
0.048	1.065	0.089	1.140
0.051	1.070	0.091	1.145
0.054	1.075	0.094	1.150

### B.2 Cylindrical surfaces

Tables B.3 to B.6 give the correction factors when tests are made on cylindrical surfaces. The correction factors are tabulated in terms of the ratio of the mean diagonal  $d$  of the indentation to the diameter  $D$  of the cylinder.

**Example** Concave cylinder, one diagonal of the indentation parallel to axis,  $D = 5\text{mm}$

Test force,  $F = 294.2 \text{ N}$

Mean diagonal of indentation,  $d = 0.415 \text{ mm}$

$$\frac{d}{D} = \frac{0.415}{5} = 0.083$$

$$\text{Vickers hardness} = 0.189 \times \frac{294.2}{0.415^2} = 323 \text{ HV30}$$

Correction factor from table B.6 = 1.075

Hardness of cylinder =  $323 \times 1.075 = 347 \text{ HV 30}$

**Table B.3 Convex cylindrical surfaces-Diagonals at 45° to the axis**

$d/D$	Correction factor	$d/D$	Correction factor
0.009	0.995	0.119	0.935
0.017	0.990	0.129	0.930

**Annex C (informative)**  
**Procedure for periodic checking of the testing**  
**machine by the user**

### **Introduction**

This Annex is to supplement the matters related to the text and Annex (normative) and not to constitute the provisions of this Standard.

A check of the machine should be carried out on each day that the machine is used, at approximately each hardness level and for each range or scale that is to be used.

Prior to making the check, the measuring system should be indirectly verified (for each range/scale and hardness level) using a reference indentation on a hardness reference block, calibrated in accordance with JIS B 7735 [6]. The measured dimension should agree with the certified value to within the maximum permissible error given in JIS B 7725. If the measuring system fails this test, appropriate action should be taken.

The check involves at least one indentation being made on a hardness reference block, calibrated in accordance with JIS B 7735. If the difference between the mean measured hardness and the block's certified value is within the permissible error limits given in JIS B 7725, the machine may be regarded as satisfactory. If not, an indirect verification should be performed.

A record of these results should be maintained over a period of time, and used to measure reproducibility and monitor drift of the machine.

**Annex D (normative)****Vickers hardness calculation table****Introduction**

This Annex specifies the hardness values calculated by the Vickers hardness equation in table 2 of the text.

**D.1 Scope**

This Annex gives tables of Vickers hardness for use in tests made on flat surfaces.

**D.2 Tables of Vickers hardness for use in test made on flat surfaces**

See table D.1 for range <HV 0.2.

See table D.2 for range HV 0.2 to HV 3.

See table D.3 for range HV 5 to HV 100

**Table D.1 <HV0.2 (d: 0.020 mm to 0.211 mm)**

Mean diagonal of indentation d mm	Test force F (N)							
	0.009 807	0.019 61	0.049 03	0.098 07	0.196 1	0.245 2	0.490 3	0.980 7
